Receiving Analytics Two-Tab Analytics Catalog

- **Last Updated:** 2026-10-29
- **Module:** Ship/Rec Tools
- **Status:** Wish list only — nothing on this list is built yet

This document lists everything the Receiving Analytics page could show you once it is split into two tabs. Nothing here is a commitment. It is a menu to pick from.

What The Page Will Look Like

The page becomes two tabs that answer two different questions.

- **ERP Data** — what you have today. It reads Infor Visual and answers "what did the business receive, and what is still coming?" It keeps its current filters and charts unchanged.
- **App Data** — new. It reads our own receiving application and answers "what did we actually do, when, how, and how well?" It gets its own filters, because it needs a different date range.

Tab 2 is the reason this work exists. Infor Visual knows what arrived at the plant. Only our app knows who received it, how long it took, whether it was on time, and what went wrong.

How To Read This List

- Each line has a number. Use the number when you tell me which ones you want.
- Lines marked with a star are the ones worth building first.
- Every line says what you would see on the page and what question it answers for you.

Start Here: The Eight Worth Building First

These cover four panels and fit on one screen without scrolling.

- **1, 2, 3 — How busy were we.** Loads per day, labels per day, and quantity received by category, each with a weekly and monthly view.
- **11 — Were we on time.** Received early, on time, or late against the PO due date.

- **17 — What is stuck.** Open quality holds and how old they are.
- **20 — Who is filling our dock.** Top suppliers by labels, quantity, and loads, with the leading few suppliers showing how much of the total they account for.
- **8, 9 — How much does our app actually see.** Our app's receipts next to what Infor Visual recorded for the same period, overall and by category.

The last two are the only ones that need both tabs. They are what proves the app is capturing the real work. Without them, Tab 2 is just another dashboard.

Everything Else

How Busy We Were

- **1 ★ Loads received** — one bar per day, with weekly and monthly trends. Tells you how many loads
  were worked.
- **2 ★ Labels per day** — one line per day. Tells you how many labels were printed and applied.
- **3 ★ Quantity by category** — stacked bars for Parts, Coils, Flat, Outside Service, and Uninventoried. Tells you what kind of material is coming in.
- **4 Quantity by unit of measure** — how much came in pounds, pieces, or coils. Tells you whether we
  are measuring the same way everywhere.
- **5 Load density** — average labels per load and average quantity per label, by week. Tells you whether loads are getting bigger or smaller.
- **6 Receiving clock** — a grid of hour by weekday showing when the dock is busiest. Tells you when
  you need people.
- **7 Touches per employee per day** — a top-ten bar. Tells you who is doing the receiving.

How We Compare To The System Of Record

- **8 ★ Receipt coverage** — two lines on one chart: what our app recorded against what Infor Visual recorded for the same dates. Tells you how much of the real work we are capturing.
- **9 ★ Category mix, side by side** — our app's split against Visual's split. Tells you whether we classify material the same way the ERP does.
- **10 PO line capture rate** — the percentage of received PO lines that came through our app. Tells you whether the gap is closing.

Whether We Received On Time

- **11 ★ On-time receipt** — stacked bars for early, on time, and late against the PO due date. Tells you whether suppliers and the dock are keeping their promises.
- **12 Lateness spread** — how many days early or late, as a distribution. Tells you how late we are when we are late.
- **13 Short and over receipt** — received quantity against ordered quantity, by supplier. Tells you who ships short.
- **14 Partial lines** — the percentage of lines that were not complete when received. Tells you how much is left hanging open.
- **15 Non-PO share** — the percentage of receipts with no purchase order, and the leading reasons. Tells you how much arrives off the books.
- **16 Reprint rate** — the percentage of labels printed twice, by user and supplier. Tells you how much label stock is being wasted.

Quality Holds

- **17 ★ Open holds** — how many holds are open right now, and how long they have been open.
- **18 How fast holds get cleared** — average and worst-case time from hold to acknowledgement, by
  week. Tells you whether quality is keeping up.
- **19 Holds by reason** — the most common restriction types and the parts behind them. Tells you what keeps getting restricted.

Suppliers

- **20 ★ Supplier ranking** — a bar chart of the top suppliers plus the running share they add up to. Tells you who matters most.
- **21 Supplier scorecard** — a scatter of how much each supplier sends against how often they are on
  time. Separates the big reliable suppliers from the big unreliable ones.
- **22 Supplier exception profile** — a table of non-PO rate, reprint rate, and hold rate per supplier. Tells you who causes the most extra work.
- **23 New suppliers** — how many suppliers we received from for the first time this month.

How The Material Was Packaged

- **24 Package mix** — a breakdown of skids, coils, sheets, and other package types.

- **25 Package density by supplier** — average quantity per package and average packages per load.
  Tells you whether we are over-packaging.
- **26 Coils per skid** — a distribution of how many coils went on each skid. Tells you whether the coil rules are being followed.
- **27 Skid make-up** — how many skids per load and how many labels per skid.

Where Material Was Put

- **28 Location heat** — the most used put-away locations as a bar chart. Tells you where material is piling up.
- **29 Location drift** — how the mix of locations changes over time. Tells you whether a corner is quietly filling up that should not be.

Dunnage

- **30 Dunnage by type** — quantity of each dunnage type and unit per day.
- **31 Dunnage by location** — where dunnage is being recorded.
- **32 Dunnage to receiving ratio** — how many dunnage records we create for every receiving label.
  Tells you whether the extra steps are earning their keep.
- **33 Dunnage by user** — who is recording dunnage work.

Outside Service

- **34 Request volume** — how many outside service requests and lines are created each week.
- **35 Phase funnel** — how many lines are in setup, shipped, and completed. Tells you where requests
  get stuck.
- **36 Turnaround and on-time ship** — average time from scheduled ship to completed, and the percentage shipped on time.
- **37 Open request aging** — how old the open requests are, grouped by phase.
- **38 Vendor workload** — how many lines each outside service vendor is handling.

Heat And Lot Markings

- **39 Marking coverage** — the percentage of heat-bearing receipts that have a marking recorded. Tells you whether every lot is marked.

- **40 Manual overrides** — how often a marking had to be changed by hand, and the leading reasons.
  Tells you whether the automatic marking is good enough.
- **41 Distinct heats per week** — how many different heats we handled, optionally by supplier.
- **42 Missing heat** — the percentage of inventoried coils and flat stock received with no heat number. Tells you whether we are losing traceability at the door.

Barcode Scanner

- **43 Session success rate** — how many scanned items went through against how many failed.
- **44 Top failures** — the most common failure reasons. Tells you what breaks most often.
- **45 Scan throughput** — items per hour, and how many are waiting in the queue.

Who Is Using The App, And How Complete Is The Data

- **46 Active users per day** — how many people used the app each day.
- **47 Field completeness** — the percentage of receipts with a heat number, a location, a part description, and a unit of measure. Tells you where our data is thin.
- **48 How records were created** — the split between manual entry, edit mode, and the barcode scanner. Tells you whether the scanner is actually replacing typing.
- **49 How long records sit** — the average time between a label being created and the receipt being
  filed away.
- **50 Cross-module activity** — receiving, dunnage, and Volvo work on one chart. Tells you how busy
  the whole department was, not just receiving.

Things That Will Limit Some Numbers

- **Different units cannot be added together.** A quantity may be in pounds, pieces, or coils. Twelve pieces plus three thousand pounds plus five coils is not a total. Any total that mixes units needs either a unit filter or a separate line per unit. This affects items 3, 13, 20, and 25 the most.
- **There are two different kinds of date.** We record the date the material was received and the date the record was entered. Those are usually but not always the same day. Charts should follow the received date, which means some days will read slightly differently than they do today.
- **Our category names do not match the ERP's.** Infor Visual uses five categories. Our app only knows Coil, Sheet, and Standard. Items 8 and 9 need a translation between the two, and that

translation must live in one place so the two tabs never disagree.

- **Some hold records point at an old table.** Hold tracking was built against a load table that is no longer part of the current database. That needs confirming before hold numbers are trusted.
- **Some numbers need a database change.** A few totals cannot be produced from what is stored today
  without new database work, which needs approval before anyone starts.
- **Weight is not used anywhere.** The old weight fields are not filled in reliably and are not part of any calculation, so weight will not appear on the new tab.

Questions I Need You To Answer

- **Do you want the comparison to Infor Visual at all?** If yes, items 8 to 10 stay. If no, Tab 2 becomes a simpler operations dashboard and the two tabs no longer have to line up.
- **Should today's unfinished work be included?** Our data holds both completed receipts and work
  still in progress. Including in-progress work means today always looks lower than it really is.
- **Are there targets?** If there are goals for on-time percentage, reprint rate, or open holds, the page can show red and green instead of plain numbers.
- **Is per-person data acceptable on screen?** Items 7, 33, and 46 report on named individuals. That
  may not be something you want visible on a shared terminal.

What Has Not Been Decided

Nothing on this list is approved or scheduled. No scope has been picked, no filters have been designed, and no database changes have been requested.
