Look Ahead Actually Filters Inbound Material

Last Updated: 2026-10-19

Status: **Awaiting approval** — nothing has been changed yet for this item.

The `Look Ahead` selector (30 / 60 / 90 / All) currently changes ordering and wording only. It does not remove anything from the board, even though the card text says it does.

What You See Before

With `Look Ahead: 30` selected, a part whose only inbound purchase order arrives in five months still shows that purchase order:

```
Incoming Material
Received 0   Ordered 13,000   Remaining 13,000
1 purchase order, 1 PO line
```

and the card can be sorted on that far-off date. Nothing on the card explains that the material is outside the window you picked.

When no inbound quantity exists, the empty state says:

```
No qualifying incoming material was found for the selected look-ahead window.
```

That sentence promises a filter that is not applied. The window is also not applied to the Associated Parts list; it only decides whether a future job is grouped as "inside" or "outside" the window for ordering purposes.

What You Would See After

Option A — the selector becomes a real filter:

- Inbound purchase order lines dated after the window are hidden from the card, from the `Remaining` totals, and from the sort.

- Associated Parts runs keep their current behaviour (still listed, still labeled) because seeing a job beyond 90 days is useful.
- The empty-state sentence becomes true, and the header states the window that was applied, for example `Incoming Material (next 30 days)`.

Option B — the selector stays a highlight, and the wording catches up:

- The control is renamed to something like `Highlight window`.
- The empty-state sentence drops the promise: `No inbound material found for this part.`
- Rows outside the window carry a visible marker such as `beyond 30 days`.

Why It Matters

`Remaining` is read as "what is coming", and management uses it to decide whether to expedite. Mixing a five-month-out balance into that number, while the screen says "30 days", makes the number mean something different from what the label says.

Which Option I Recommend

Option A for inbound material quantities, Option B for associated runs. That keeps the quantity totals honest while keeping long-range job visibility.

Decision Needed

- Option A or Option B?
- If Option A: should `All` remain in the list, and should the header show the applied window?
